

Ontology

What is an ontology?

In philosophy,

- *"ontology is the study of being or existence. It seeks to describe or posit the basic categories and relationships of being or existence to define entities and types of entities. "*¹⁾

In modern computer science and information science basic definitions consider an ontology to be:

- *"a data model that represents a set of **concepts** within a domain, and the **relationships** between those **concepts**"*²⁾
- *"an explicit specification of a conceptualization."*³⁾
- *"an explicit formal specification of the terms in the domain and relations among them "*⁴⁾

In more details, an ontology can be described as:

- a formal explicit description of **concepts** or *classes* in a domain of discourse, with
- **properties of each concept** describing various features and attributes of the concept (*slots, roles or properties*), and
- **restrictions on concept** slots (*facets or role restrictions*).⁵⁾

An ontology has the following properties:⁶⁾

- it is used to reason about the objects in a domain;
- specifies the classes of concepts and their relations at a higher level than relevant to the domain;
- captures the intrinsic conceptual structure of a domain;
- forms the hearth of the knowledge representation within a domain.

Why do we need an ontology?

An ontology can be used to:⁷⁾

- *share common understanding of the structure of information among people or software agents*
- *enable reuse of domain knowledge*
- *make domain assumptions explicit*
- *separate domain knowledge from the operational knowledge*
- *analyze domain knowledge*

So how do you create an ontology?

You can follow this brief guide.
